Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1-23.   (Cancelled)

24.   (Currently Amended) A~~n~~ **n** ~~cellular communication terminal for fetching content from at least one server, the terminal~~**apparatus** comprising:

a receiver and a transmitter ~~which~~**configured to** receive[[s]] and transmit[[s]] data packets from at least one server through a link which transmits the data packets between the terminal and ~~the~~ at least one server;

a first memory comprising an identifier and at least one item, the at least one item ~~being provided with~~**having** an access point which indicates a location of the at least one server to be accessed, wherein the at least one server is accessed by sending the identifier to the link to identify a first content to be access[[ed]]**ible** at the at least one server, and wherein the first content is associated with link content provided at different locations in the at least one server or in another server;

a ~~browser application, which~~**processor configured to read an item from the first memory and to** establish[[es]] a session to the link ~~by reading an item from the first memory~~, and **to** fetch[[es]] a copy of the first content from the at least one server, at the location indicated by the access point, to be stored in the first memory or in a second memory, wherein the second memory **is arranged to store** temporarily or permanently ~~stores~~ the copy of the first content;

a user interface connected to the **processor, the user interface including**~~browser application having~~ a display ~~which~~**configured to** display[[s]] the copy of the first content received from the at least one server and a user input ~~which~~**configured to** control[[s]] the **processor**~~browser application~~; and

wherein **the receiver and transmitter are configured to fetch** a copy of the first content and a copy of the link content ~~is fetched~~ simultaneously upon a request generated by

the **processor**browser application, the **transmitter configured to send the** request being sent through the transmitter as a data packet, comprising an instruction to the at least one server to send the copy of the first content from a given location in the at least one server, indicated by the access point, together with a copy of the link content, simultaneously.

25. (Currently Amended) A**n apparatus**cellular communication terminal according to claim 24, wherein the first content and the link content is provided in the same server.

26. (Currently Amended) A**n apparatus**cellular communication terminal according to claim 24, wherein a pull means is provided with a selecting means, in order to choose which content is to be fetched.

27. (Currently Amended) A**n apparatus**cellular communication terminal according to claim 24, wherein the second memory is an external memory, provided with a connection to the terminal.

28. (Currently Amended) A**n apparatus**cellular communication terminal according to claim 24, wherein the second memory is in the terminal.

29. (Currently Amended) A**n apparatus**cellular communication terminal according to claim 24, wherein the second memory is a cache memory.

30. (Currently Amended) A**n apparatus**cellular communication terminal according to claim 24, wherein the first memory is a SIM card.

31. (Currently Amended) A**n apparatus**cellular communication terminal according to claim 24, wherein the **apparatus**terminal is a cellular phone.

32. (Currently Amended) A method **comprising**for fetching content from at least one server to a cellular communication terminal, the cellular communication terminal comprising a first memory and a browser application, wherein the method comprises the following steps:

reading an item in ~~the~~ first memory and an identifier, ~~by means of the browser application,~~ the item comprising at least one access point indicating the location of a server to be accessed;

generating a request ~~by means of the browser application~~, the request comprising information of the at least one access point, and the identifier identifying a first content of the at least one access point, the first content being associated with link content provided at different locations in the server or in another server;

initiating a session to a link, by transmitting the request from the cellular communication terminal to the link, the link sending data packets between the terminal and the server;

identifying the request at the link; and

establishing a session between the terminal and the link ~~by sending a response from the link to the terminal~~, wherein the request ~~is generated by the browser application and~~ has an instruction to the server to send a copy of the first content from a given location in the server, indicated by the access point, together with a copy of the link content, simultaneously, and ~~wherein the cellular communication terminal~~

fetch[[es]]**ing** a copy of the first content and a copy of the link content simultaneously.

33.   (Previously Presented) A method according to claim 32, wherein the copy of the first content and the link content is stored in a second memory.

34.   (Previously Presented) A method according to claim 32, wherein the copy of the first content and the link content are from the same server.

35.   (Currently Amended) A method according to claim 34, **comprising**~~wherein the cellular_communication terminal~~ fetch[[es]]**ing** a copy of the link content from a further server.

36.   (Canceled).

37.   (Canceled).

38.   (Canceled).

39.   (Canceled).

40.   (Canceled).

41.   (Canceled).

42.   (Canceled).

43.   (Currently Amended) A ~~communication device for accessing a server accessible via a proxy, the~~ device comprising:

a transceiver and a **processor**~~browser~~, the transceiver **configured to** establish[[ing]] a session with **a**~~the~~ proxy, the proxy providing access to **a**~~the~~ server ~~wherein~~ the **processor**~~browser~~ is operable **to generate and make a request and** to retrieve first content from the server simultaneously with further content linked to the first content ~~by making a request generated by the browser~~.

44.   (Currently Amended) A device as claimed in claim 43, further including a memory in which at least the retrieved first content is stored.

45.   (Currently AMended) A device as claimed in claim 43, wherein the **processor**~~browser~~ **is configured to** retrieve[[s]] the further content from a further server.

46.   (Currently Amended) A device as claimed in claim 43, wherein the **processor**~~browser~~ is selectively operable to retrieve the further content.

47.   (Currently Amended) A method ~~of fetching content from a server,~~ comprising:

receiving data packets;

within the data packets, receiving a request, the request comprising information of at least one access point indicating a location of the server to be accessed and an instruction to the server to send a copy of a first content from a location in the server together with a copy

of link content simultaneously, wherein the first content of at least one access point is identified by an identifier and the first content is associated with the link content provided at different locations in at least one of the server and another server; and

effectuating a process of simultaneously fetching the copy of the first content and the link content from the server.

48.   (Previously Presented) A method according to claim 47, wherein the copy of the first content and the link content are from the same server.

49.   (Previously Presented) A method according to claim 47, wherein the copy of the first content and the link content is stored in a memory of a cellular communication terminal.

50.   (Previously Presented) A computer program product, embodied on a computer-readable medium comprising computer code configured to perform the processes of claim 47.

51.   (Previously Presented) A server, comprising:

a processor unit; and

a memory unit operatively connected to the processor unit and including:

computer code configured to receive data packets;

computer code configured to receive a request within the data packets, the request comprising information of at least one access point indicating a location of the server to be accessed and an instruction to the server to send a copy of a first content from a location in the server together with a copy of link content simultaneously, wherein the first content of at least one access point is identified by an identifier and the first content is associated with the link content provided at different locations in at least one of the server and another server; and

computer code configured to effectuate a process of simultaneously fetching the copy of the first content and the link content from the server.

52.   (Previously Presented) A server according to claim 51, wherein the copy of the first content and the link content are from the same server.

53.   (Currently Amended) A method ~~of fetching content from a server,~~ comprising:

transceiving data packets from at least one server during an established session;

effectuating access to the server by receiving an access point indicating a location of the server to be accessed and an identifier identifying a first content to be accessed, wherein the first content is associated with link content provided at different locations in one of the server and another server; and

participating in a fetching process comprising fetching a copy of the first content from the server at the location indicated by the access point and fetching a copy of the link content simultaneously in response to a request sent as a data packet included within the transceived data packets, the request including an instruction to the server to send the copy of the first content from a given location in the server indicated by the access point together with the copy of the link content, simultaneously.

54.   (Previously Presented) A method according to claim 53, wherein the first content and the link content is provided in the same server.

55.   (Previously Presented) A computer program product, embodied on a computer-readable medium comprising computer code configured to perform the processes of claim 53.

56.   (Previously Presented) A server, comprising:

a processor unit; and

a memory unit operatively connected to the processor unit and including:

computer code configured to transceive data packets from at least one server during an established session;

computer code configured to effectuate access to the server by receiving an access point indicating a location of the server to be accessed and an identifier identifying a first content to be accessed, wherein the first content is associated with link content provided at different locations in one of the server and another server; and

computer code configured to participate in a fetching process comprising fetching a copy of the first content from the server at the location indicated by the access point and fetching a copy of the link content simultaneously in response to a request sent as a data packet included within the transceived data packets, the request including an instruction to the server to send the copy of the first content from a given location in the server indicated by the access point together with the copy of the link content, simultaneously.

57. (Previously Presented) A server according to claim 56, wherein the first content and the link content is provided in the same server.

58. (Previously Presented) A computer program product, embodied on a computer-readable medium for fetching content from at least one server comprising:

computer code configured to receive and transmit data packets from at least one server through a link which transmits the data packets between the terminal and the at least one server;

computer code configured to store in a first memory, an identifier and at least one item, the at least one item is provided with an access point which indicates ~~the~~ a location of the at least one server to be accessed, wherein the at least one server is accessed by sending the identifier to the link to identify a first content to be accessed at the at least one server, and wherein the first content is associated with ~~the~~ link content provided at different locations in the at least one server or in another server;

computer code configured to establish a session to the link by reading an item from the first memory, and fetching a copy of the first content from the at least one server, at the

location indicated by the access point, to be stored in the first memory or in a second memory, wherein the second memory temporarily or permanently stores the copy of the first content;

computer code configured to display the copy of the first content received from the at least one server and a user input which controls the browser application; and

computer code configured to fetch a copy of the first content and a copy of the link content simultaneously upon a request generated by the browser application, the request being sent through a transmitter as a data packet, comprising an instruction to the at least one server to send a the copy of the first content from a given location in the at least one server, indicated by the access point, together with a copy of the link content, simultaneously.

59.　(Previously Presented) A computer program product according to claim 58, wherein the first content and the link content is provided in the same server.

60.　(New) An apparatus according to claim 24, wherein the apparatus is a cellular communications terminal.
